System for access control from data station to mobile data carriers comprising at least two mobile data carriers (51) and one data station (61), each mobile data carrier having

- a tuned circuit (56) for inductively coupled signal transmission to the data station (61), the oscillation of which tuned circuit (56) can be modulated either with a signal at a first frequency (f_1) or with a signal at a second frequency (f_2) as a function of a bit, which is to be transmitted, of an identification tag,

the data station having

- a tuned circuit (60) for inductive reception of signals which are transmitted from the data carriers,
- filter means (64,65) which are coupled to the tuned circuit (60), for separating the received signal into a frequency range containing the first frequency (f_1) and a frequency range containing the second frequency (f_2), each frequency being assigned to one bit value in the identification tag,

the data carriers (51) being constructed to transmit an identification tag synchronously on request of the data station, and

- a control device (68) which is coupled to the filter means (64,65) and by means of which the reception of two different bit values located at the same bit position in the identification tag can be confirmed,

said control device (68) being constructed to control said data station (61) such that, if two different bit values have been confirmed by the control device (68) as having been received at at least one bit position in the identification tag, those data carriers (51) whose identification tag have a bit value different from the bit value defined by the data station (61) at the bit position, are changed to a passive state by an instruction from the data station and the data carriers (51) whose identification tag have a bit value defined by the data station (61) at the bit position are instructed by the data station (61) to transmit at least a part of the identification on tag once again.

CLAIMS.

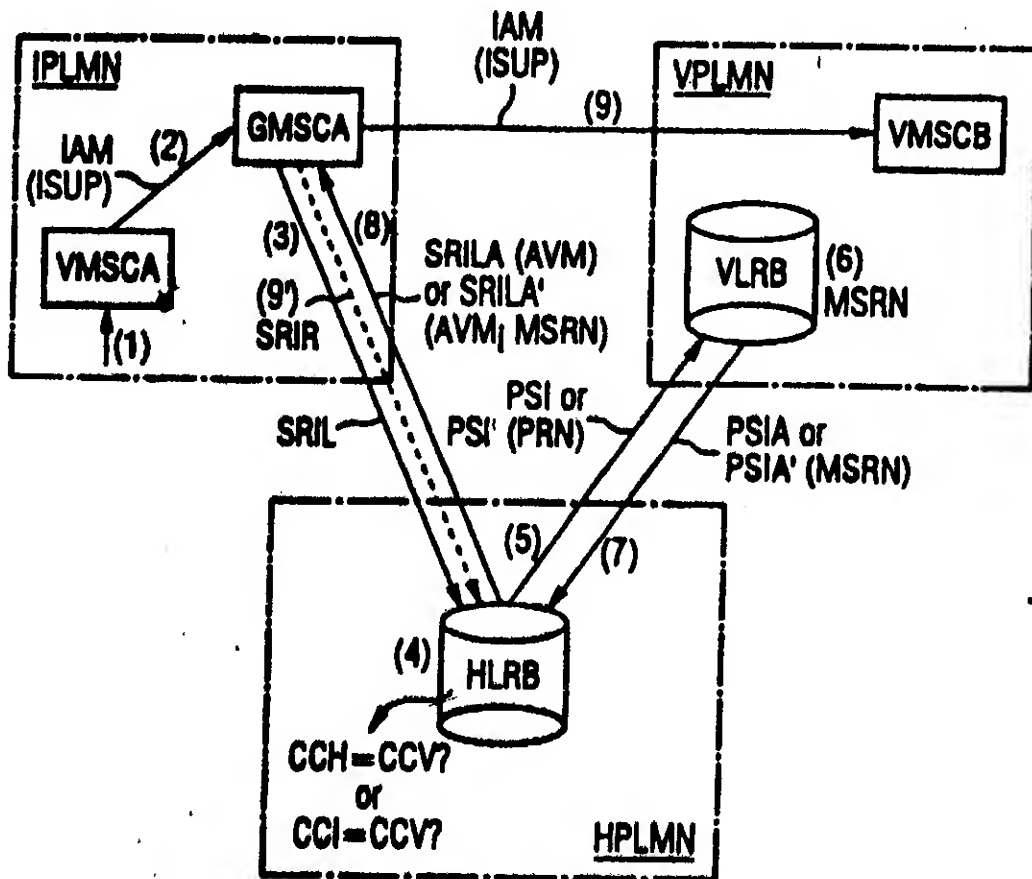

Method for determining the location of a mobile subscriber registered in a cellular radio network for optimal routing in the case of a mobile terminated call, in which

- on the basis of the subscriber call number of the called mobile subscriber, an internetwork message (SRIL) for interrogating location is sent from a gateway mobile switching centre (GMSCA) of a first network (IPLMN) to a home location register (HLRB) of another network (HPLMN) in which the mobile subscriber is permanently registered with his subscriber data,

- the home location register (HLRB) directs a message (PSI or PSI') for interrogating the location to a visitor location register (VLRB) of a further network (VPLMN) in which the mobile subscriber is currently registered due to his current location and allocates a visited mobile switching centre (VMSCB) to the visitor location register (VLRB), and in which

- for supporting optimal routing, a check is made whether a direct connection can be established between the gateway mobile switching centre (GMSCA) and the visited mobile switching centre (VMSCB) for reasons of charging for the call,

characterized in that when the message (SRIL) for location interrogation is received, the home location register (HLRB) checks the feasibility of setting up the direct connection and, if the result of the check is positive, sends a modified message (PSI') additionally containing a code (PRN) for requesting a temporary mobile subscriber roaming number (MSRN) to the visitor location register (VLRB).

4 CLAIMS.

An improved method for transmitting data between a terminal and a portable data carrier via a wireless electromagnetic transmission link, the improvement comprising the step of:

transmitting a carrier signal that is amplitude shift keying (ASK) modulated in accordance with the data and the carrier signal serving as a clock signal for the portable data carrier, a significance of the data determined by a position of a shift keying point in the carrier signal within a time slot, an information content of the shift keying point corresponding to a number of N bits where N being greater than or equal to 2 and a significance of the N bits defined by the position of the shift keying point within 2^N possible positions within the time slot

wherein one of a start and an end of the time slot there is a zero time period in which no shift keying point occurs in the data to be transmitted.

4 CLAIMS.

A leak preventive sanitary pad comprising:

a hydrophilic top layer (20);

a waterproof bottom layer (21);

a hydroscopic intermediate layer (22) stuffed in between said hydrophilic top layer (20) and said waterproof bottom layer (21);

a hip area (23), a groin area (24), and a lower abdomen area (25) extended from said hydrophilic top layer (20) and said waterproof bottom layer (21);

two hip wings (26) respectively extended from two opposite lateral sides of said hip area (23);

two abdomen wings (27) respectively extended from two opposite lateral sides of said lower abdomen area (25);

and two bottom wings (28) respectively extended from two opposite lateral sides of said groin area;

wherein:

21 Claims

A process for urea synthesis from ammonia and carbon dioxide, with ammonium carbamate being formed as an intermediate species, which comprises the following steps: (a) feeding ammonia and carbon dioxide to at least one reactor and causing them to react with each other, with a molar ratio of $\text{NH}_3:\text{CO}_2$, either as such, or as ammonium carbamate, comprised within the range of from 2.1 to 10, with a first liquid mixture containing urea, ammonium carbamate, water and ammonia being formed at a temperature from 170 to 250°C and under pressures from 120 to 180 abs. atm. (b) transferring said first liquid mixture to a decomposition-stripping step; (c) heating said first liquid mixture in said decomposition stripping

step at a temperature of 160 to 220° C operating substantially under the same pressure as existing in said reactor, to cause a portion of ammonium carbamate to get decomposed into ammonia and carbon dioxide, and simultaneously stripping said liquid mixture, with a first gas mixture containing ammonia and carbon dioxide, and a second liquid mixture containing urea, water, ammonia, and the undecomposed portion of ammonia carbamate, being formed; (d) transferring, through an ejector, said first gas mixture to a condensation step substantially operating under the same reactor pressure and condensing said mixture, with a third liquid mixture being formed which contains ammonium carbamate and ammonia, which third liquid mixture is recycled, through an ejector, to the reactor of the step(a); (e) recovering urea contained in said second liquid mixture in one or more subsequent decomposition/separation step (s) with substantially pure urea, a fourth liquid mixture containing water, ammonia and ammonium carbamate and, possibly, a fifth stream substantially containing ammonia, being formed; characterized in that said fourth liquid mixture formed in step (e) is totally or partially, preferably from 50 to 100% thereof, combined with said first liquid mixture and sent to said first decomposition stripping step, with the residual portion, if any, being sent to the reactor, or preferably, to said condensation step.

(Claims 07)

Continuous extrusion apparatus having a rotatable wheel (2) formed with at least one circumferential groove (26), arcuate tooling (6) bounding a radially outer portion of the groove (26) provided with an exit aperture (28) and an abutment face (48) displaced in the direction of rotation from the exit aperture, wherein the arcuate tooling (6) includes a die top (22) formed with the exit aperture (28) and a wedge shaped recess (30) accommodating an abutment body (24), the abutment body (24) having a face (42) provided with at least one spine (44) flanked by shoulders (46) arranged to co-act with a cylindrical surface (52) of the wheel flanking the circumferential groove (26), a face (36) remote from the abutment face (48) arranged to co-act with a complementary face (40) of the wedge-shaped recess (30) and, with the abutment body (24) in connection with the wheel (2), lying on a plane parallel to and displaced from an axial plane containing the wheel axis such that a component of forces arising at the abutment face (48) serving to displace feed material from the circumferential groove (26) to the exit aperture (28) upon rotation of the wheel (2) acts in a direction urging the abutment body (24) into the wedge-shaped recess (30).

 - (a) using distilled or deionized water to establish an additive aqueous alkali metal silicate solution containing from 10 to 30 weight percent SiO₂ and having an SiO₂:M₂O molar ratio of from 1.0 to 3.0, and using distilled or deionized water to establish an initial aqueous alkali metal silicate solution containing from 0.5 to 4.5 weight percent SiO₂ and having an SiO₂:M₂O molar ratio of from 1.0 to 3.0;**
 - (b) over a period of at least 10 minutes and with agitation, adding acid to the initial aqueous alkali metal silicate solution at a temperature below 65°C to neutralize at least 80 percent of the M₂O present in the initial aqueous alkali metal solution and thereby to form a first reaction mixture;**
 - (c) over a period of from 30 to 180 minutes, with agitation, and at a temperature of from 85°C to 95°C, substantially simultaneously adding to the first reaction mixture: (1) additive aqueous alkali metal silicate solution, and (2) acid, thereby to form a second reaction mixture wherein the amount of the additive aqueous alkali metal silicate solution added is such that the amount of SiO₂ added is from 0.5 to 2.0 times the amount of SiO₂ present in the initial**

- aqueous alkali metal silicate solution established in step (e) and wherein the amount of the acid added is such that at least 60 percent of the M_2O contained in the additive aqueous alkali metal silicate solution added during the simultaneous addition is neutralized;
- (d) adding acid to the second reaction mixture with agitation at a temperature of from 85°C to 95°C to form a third reaction mixture having a pH below 9.3;
- (e) aging the third reaction mixture with agitation at a pH below 9.3 and at a temperature of from 85°C to 95°C for a period of from 0 to 120 minutes;
- (f) forming a fourth reaction mixture by adding to the aged third reaction mixture with agitation and at a temperature of from 85°C to 95°C , a further quantity of additive aqueous alkali metal silicate solution and adding acid as necessary to maintain the pH at from 7.5 to 9.2 during the addition of the further quantity of the additive aqueous alkali metal silicate solution, wherein the amount of the additive aqueous alkali metal silicate solution added in step (f) is such that the amount of SiO_2 added in step (f) is from 0.05 to 0.30 times the amount of SiO_2 present in the third reaction mixture;
- (g) aging the fourth reaction mixture with agitation at a temperature of from 85°C to 95°C for a period of from 5 to 60 minutes;
- (h) adding acid to the aged fourth reaction mixture with agitation at a temperature of from 85°C to 95°C to form a fifth reaction mixture having a pH below 7.0;
- (i) aging the fifth reaction mixture with agitation at a pH below 7.0 and at a temperature of from 85°C to 95°C for a period of at least 5 minutes;
- (j) separating precipitated silica from most of the liquid of the aged fifth reaction mixture;
- (k) washing the separated precipitated silica with dionized or distilled water; and
